

PRD: Broker Research Entitlements for Generative Search Citations

1. Executive Summary

Generative search already synthesizes answers with sentence-level citations, but broker research citations today do not consistently enforce seat and organization-wide entitlements before content is shown. This PRD extends **Broker Research Entitlements** so that every generative search citation to broker research is gated the same way as direct broker content access — before summarization, at citation render time, and in audit logs.

Primary touchpoints: **Broker Research Entitlement Guard** (Premium Content Gate) and **Generative Answer Composer**.

2. Problem & Opportunity

Research users expect generative answers to cite broker research they are entitled to see. When citations surface non-entitled broker content — even as metadata, excerpts, or clickable links — it creates compliance risk and erodes trust in generative search. The opportunity is to close this gap without regressing answer quality for entitled users or blowing query latency budgets.

3. Goals

- Enforce organization-wide and seat-level broker research entitlements before generative summarization and citation rendering
- Preserve sentence-level citation fidelity for sources the user is entitled to access
- Make entitlement allow/deny decisions auditable for compliance review
- Roll out behind the existing entitlement guard with no separate policy surface

Non-Goals

- Replacing subscription contract ingestion or admin entitlement configuration workflows
- Changing boolean/semantic hybrid retrieval behavior beyond applying uniform entitlement gating
- On-prem appliance packaging or legacy terminal workflow replacement

4. Functional Requirements

FR	Requirement
----	-------------

FR-1	The system shall evaluate organization-wide broker research entitlement rules for every user session before broker research content is included in generative search results or citations.
FR-2	The system shall resolve seat-level broker research entitlements for the requesting user before any generative summarization of broker research documents begins.
FR-3	The system shall block or mask broker research source material in generative answers when the requesting user's seat lacks the required entitlement, rather than deferring the check until after the answer is composed.
FR-4	Every sentence-level citation in a generative search answer that references broker research shall be gated by an entitlement check at citation render time.
FR-5	Citations to broker research the user is not entitled to shall not appear as clickable or copyable references; the system shall substitute an entitlement-denied state with no broker-identifying metadata exposed.

FR-6	Generative search shall continue to provide synthesized answers with sentence citations for entitled broker research, preserving citation fidelity for permitted sources only.
FR-7	Entitlement decisions for generative search citations shall be auditable: each allow/deny outcome shall record user, tenant, broker source, timestamp, and entitlement rule applied.
FR-8	Compliance administrators shall be able to review entitlement enforcement events for generative search citations without accessing the underlying broker research content.
FR-9	Organization-wide entitlement policy changes shall propagate to generative search citation gating within the same enforcement path used for direct broker research access.
FR-10	When a generative answer mixes entitled and non-entitled broker sources, the system shall include citations only for entitled sources and shall not leak non-entitled broker titles, authors, or excerpts in the answer body.

FR-11	Entitlement checks for generative search citations shall not add material latency beyond existing ingestion and query latency budgets for the feature area.
FR-12	Generative search retrieval shall support boolean and semantic hybrid queries in a single query bar; entitlement gating shall apply uniformly regardless of retrieval mode.

5. Success Metrics

Metric	Target
Entitlement denial rate	Measurable and reportable per tenant for generative search citations
Citation fidelity	Sentence-level citations preserved for entitled broker research sources
Query latency	p95 hybrid retrieval latency (including entitlement checks) stays within existing feature-area SLO budgets

6. Dependencies & Risks

Dependencies

- Broker Research Entitlement Guard as the single enforcement path for both direct access and generative citations
- Seat entitlement resolution aligned with organization-wide subscription rules
- Generative Answer Composer citation pipeline integration at summarization and render time
- Ingestion and query latency SLOs for the broader generative search feature area

Risks

- Partial entitlement leaks in mixed-source answers if gating is applied only at retrieval but not at citation render
 - Latency regression if entitlement checks are duplicated or not cached across summarization and citation stages
 - Audit log volume growth as citation-level decisions are recorded per sentence
-

7. Rollout

Entitlement checks for generative search citations ship behind the same **Broker Research Entitlement Guard** used for direct content access. No separate entitlement policy surface is introduced for PMs or admins to maintain.

Suggested phasing:

1. **Internal dogfood** — entitlement gating on citation render only; audit logging enabled
 2. **Beta** — pre-summarization seat checks; mixed-source answer masking
 3. **GA** — full audit review tooling for compliance admins; latency validation against SLOs
-

Trust summary

- **Grounded in your org context:** Organization-wide entitlement rules, seat enforcement before summarization/citations, generative citation gating, compliance audit requirements, and hybrid retrieval SLOs are all established constraints for this capability area.
- **New in this PRD:** Explicit citation-render-time gating, mixed-source leak prevention in answer bodies, and compliance-admin review of citation enforcement events without content access.
- **Needs eng input:** Exact entitlement-denied UI states, caching strategy to meet latency SLOs, and audit log schema/retention policy.

Ready to share with engineering and compliance stakeholders.
